DETAILED ACTION

Specification

1. Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 250 words. It is important that the abstract not exceed 250 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

Claim Objections

2. Claim 6 is objected to because of the following informalities: the term "lest" (line 3) should have been "least". Appropriate correction is required.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 2861

4. Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over admitted prior art to Hackleman (hereinafter referred as APA) in view of Hasumi. (JP 60-104335)

APA substantially disclosed the instant claimed subject matter except for printhead is displaced a distance equal to the width of one pixel row.

Hasumi (fig.1-4, page 6) suggests supplementary printing in the case the discharge abnormality is detected. The reserve nozzle array of the printhead displaced only by a nozzle pitch (width of the pixel row) so that the change in the image quality is almost none. Therefore, It would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the technique of Hasumi in APA for the purpose of preventing interruption of recording while maintaining the image quality.
